

Needs analysis

- Has to be in a shape resembling my initials (RH)

Ideation

- Convert the R into an ergonomic WASD control with a spacebar function
 - The top of the letter as 4 buttons
 - The long right side of the R as a space bar
 - Potentially wire the left leg of the R as shift for sprint
- Convert the H into a massive lever
 - The center part of the H would be the lever and the sides would be lines to pull along
- Flight sim like controller?
 - Make the lever have some snapping positions to imitate a car stick
